

LNGT0101

Introduction to Linguistics

Lecture #5
Sept 22nd, 2014

Announcements

- Any remaining questions on homework?
- Remember the deadline is today at 5pm.

2

Today's agenda

- Finish our discussion of language and the brain.
- Main subfields of linguistics and roadmap for the rest of the semester.
- Introduce morphology: Morphemes.

3

Why do children have it easy?

- Ever wondered why you're having hard time learning a foreign language, even though you had no trouble whatsoever learning your first language?
- A critical period?

4

cuckoo

chaffinch

chaffinch

5

A critical period for language acquisition?

- So, if language has a biological component, we have an answer: Certain biological abilities follow a timetable and then get either "turned off" or "degrade" considerably, as Eric Lenneberg suggested for language in 1967.
- How do we test this hypothesis?

6

A critical period for language acquisition?

- The cases of so-called “wild children”.
- **Isabelle** discovered at the age of 6 with no language skills, but within a year she learned to speak and was able to function normally in school.
- **Genie** discovered at the age of 13, but her language development never matched what normal children do (“bathroom have big mirror”).
- **Chelsea** misdiagnosed as mentally ill, fitted with hearing aids at 31, but after 12 years of training her language level remained that of a 2 and ½ year old (“hit ball,” “cupboard put food”).

7

So, ...

- We seem to have good evidence for:
 - Dissociation between language and intelligence.
 - Uniform acquisition of language by children.
 - A critical period for learning a language natively (with the caveat we mentioned in discussion).

8

Language and the brain

- Language is neurophysiologically represented in the brain.
- For one thing, for most right-handed individuals, language is represented in the left cerebral hemisphere of the brain.

9

Language and the brain

- Since we cannot operate on the brain directly, we look for opportunities when this becomes possible.
 - Cases of language impairment due to head injury.
 - Making use of technology that allows us access to how the brain functions when it comes to language (measuring blood flow, or electric and magnetic fields associated with certain linguistic tasks).

10

Aphasia

- Aphasia is a language impairment that results from damage to certain areas in the brain, due to a stroke, trauma to the head, brain infection, etc.
- There are multiple types of aphasia, depending on where the trauma takes place.

11

Figure 14.4 Language processes in the left hemisphere. Damage to Broca's area is usually associated with nonfluent speech and difficulty processing complex syntactic patterns. Damage to Wernicke's area (see Section 3.2) is usually associated with comprehension disturbances. Damage to the area around the angular gyrus results in reading impairment.

From O'Grady et al, 2005.

12

Broca's aphasia

- Broca's aphasics typically have difficulty producing speech:
... har eat ... wit ... poon
(Intended sentence: 'It is hard to eat with a spoon.')
- They typically have problems with **function words**, e.g., articles, pronouns, prepositions, auxiliary verbs, and inflectional suffixes, from the sentence. [Example1](#) [Example2](#)

13

Wernicke's aphasia

- In *Wernicke's aphasia*, patients' speech sounds very good: There are no long pauses, sentence intonation is normal, function words are used, and word order is syntactically correct. The problem is that their speech rarely makes any sense:

I could if I can help these this like you know ... to make it. We are seeing for him. That is my father.

- [Example1](#) [Example2](#)

14

Using technology to study language and the brain

- CT scanning → static image
- PET → invasive
- fMRI → less invasive but expensive
- MEG → high time resolution but also expensive

- Cf. the relevant sections in Chapter 10 of the textbook.

15

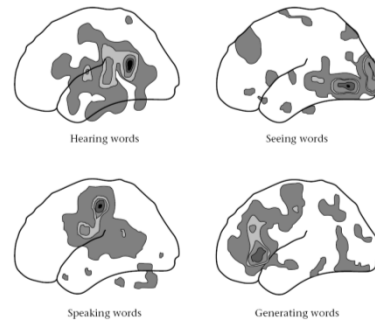

Figure 14.5 PET scans show how blood flow to the brain shifts to different locations depending on which task is being performed.

From O'Grady et al, 2005.

16

PET

- Watch a PET experiment for language processing here:
http://www.youtube.com/watch?v=5KXIDUo18aA&list=PL4DC464EA70E42A6D&index=3&feature=plpp_video

17

Goals of linguistic theory

- There are three main questions that linguists are primarily concerned with:
 - a. What is it that we know when we know a language?
 - b. How does this knowledge arise in the mind of the native speaker?
 - c. How is this knowledge put to use?

18

Grammar is a “mental” entity

- The answer to the first question is to study language as a system of knowledge in the mind of the speaker/hearer, that is, a **grammar**.
- Linguists typically break down a grammar into subcomponents and work on each:

19

Components of a mental grammar

- **Phonetics**: The study of the articulation and perception of speech sounds.
- **Phonology**: The study of the sound system in a language.
- **Morphology**: The study of word structure.
- **Syntax**: The study of sentence structure.
- **Semantics**: The study of meaning of words and sentences.

20

Other subfields within linguistics

- The answer to the second question is in the study of **first language acquisition**.
- When language is put to use, other phenomena arise that are equally worthy of investigation.
- So, linguists raise questions for the mutability of linguistic knowledge, i.e., the fact that language changes over time. This is the domain of **historical linguistics**.
- Linguists also raise questions for how we come to use language in social contexts and how people's forms of speech vary (the so-called *dialects*). This is the domain of **sociolinguistics**.

21

Other subfields within linguistics

- **Psycholinguistics**, on the other hand, studies the cognitive processes that we engage in in the production and perception of language.
- **Neurolinguistics** deals with how language is physiologically represented in the brain.
- **Computational linguistics** is concerned with ways to model natural languages so they can be used by machines.

22

Course plan henceforward

- We will cover most of these (check the syllabus), though you have to remember this is primarily an introduction to the study of language as a system, so all of the first six weeks of the semester and perhaps a lecture or two in the second half will be devoted to the study of the five main components of linguistic knowledge.
- Importantly, though, understanding these is crucial to understanding other areas of linguistics, hence the way the syllabus is organized.

23

Morphology

24

Let's do some linguistic analysis

- Work in groups of 5 and answer the questions on the handout about the languages you know, including your native languages.
- Group 1: Natalie, Lee, Sophie, Bob, Caroline.
- Group 2: Matt, Lilly, Emma, Kaya, Mason, Terumi.
- Group 3: Mika, Ella, Alice, Athraa, Bronso.
- Group 4: David, Taylor, Spencer, Maddy, Catie.

25

Let's do some linguistic analysis

1. How is plural marked in the languages in your group?
2. How is past tense marked in the languages in your group?
3. How do you say 'unbelievable' in the languages in your group?
4. Your languages probably have a word for 'clear.' But how do you say 'clarify'?

26

Next class agenda

- We figure out the system underlying word-structure in human language.
- Finish reading Chapter 2, pp. 33-49 if you haven't done that already.
- Also take a look at the exercises from the textbook on Zulu (pp. 67-68), Swedish (pp. 68), Cebuano (p. 69), and Turkish (p. 73).

27
